

Quick List– Argument Everywhere

You can find
argument
in your
everyday
life.

When are you
too old to go
trick-or-treating?

Should the legal
drinking age in
America change?

Should teachers
have control over
their own PD?

Should cancer
research prioritize
cures or prevention?

1. Went to Spirits in the Garden
2. Worked on a presentation for teacher PD
3. Sitting in dirt
4. Mise en place (prepping before cooking)
5. Talked with friends about putting together a care package for our friend who is having surgery.
6. Talked to my niece about sitting with friends in the lunchroom
7. Outlander. I need less history with my romance!
8. Royal blue. I could make a guess as to why but...
9. Crafting. Creating things.
10. Gardening.

Should we plant
non-native
species?

Should students
have assigned
seats in the
lunchroom?

Topic Sprint #1: Native Plants

I know that planting native plants in your home garden is a good thing. I am not an expert, but I've gathered a few reasons over the last couple months. (I am getting ready to build new beds this fall and I will plant in the spring. I need to decide what I want to put in these beds.) Primarily, natives are good for the wildlife because natives are safe food sources. I believe some non-natives can provide empty calories. Natives are also good for me when it comes to time and money. Natives are self-sustaining. By that I mean that they last longer in the ground, without soil amendment, and they often reseed. I might find myself replacing non-natives regularly and I would certainly have to amend my clay soil.

With all these benefits, why wouldn't I use natives? Well...ugh...they aren't always pretty! They can look quite weedy. Also, a native garden may not have the showy color variety that catches your eye. I get so much joy not only from planting but also from designing with plants, and an artist likes a full palette!

Topic Sprint #2: Cancer Research

I actually haven't given this much thought. I certainly don't have an sources to back my beliefs right now, so this will just be my initial impressions.

Cancer kills so many people and we have put a lot of money into finding a cure. We haven't cracked that code after all this time. Should we look at scaling back the money in that direction and putting some serious teeth into preventions? I don't know.

When we talk prevention, are we just talking dietary advice: beware alcohol and put down that sausage! If so, our money might not be well spent. There is so much more to people's food decisions that willpower.

But....if prevention also includes rooting out sources of cancer in our food supply or in the chemicals produced in manufacturing, then I would sit up and take notice. If we are talking policy change and refutations that would help with the kind of food or good consumed, then I might say that is where the priority lies.
